The inclusive, inelastic eD scattering cross section has been measured with the CLAS [1] detector in Hall B of the Thomas Jefferson National Accelerator Facility (TJNAF). Combining these data and previously measured world data we have extracted Nachtmann moments [2] of the deuteron structure function F_2 in the region $0.4 < Q^2 < 100 \text{ GeV}^2/c^2$. These results are published in Ref. [3]. The purpose of the present CLAS-Note is to tabulate the CLAS deuteron F_2 data. A description of the data analysis is reported in the Ref. [3].

The data were collected during the so called “E1d” and “E6a” electron beam running periods. These runs were taken in March - April 2000 and January - March 2002, respectively. The data were taken on the 5 cm long liquid deuteron (LD) target, located in the center of CLAS. The trigger was set by a coincidence of hits in the Cherenkov Counter (CC) and the Electromagnetic Calorimeter (EC). In E6a run period Level 2 trigger (L2), requiring a track candidate in the same sector of the EC hit, was set to reduce the background rate [4]. More details on the run conditions and the total number of electron triggers collected in these experiments are given in the Table 1.

The kinematic region accessible with these data is shown in Fig. 1: E1d run period data cover the lower Q^2 region from 0.4 up to 1.5 GeV^2 , while the higher Q^2 area is filled by E6a data, situated from 1.5 up to 6 GeV^2 . Combining the two data sets we obtained the continuous kinematic coverage from 0.4 up to 6 GeV^2 at large x values.

Table 1: Run conditions and the total number of triggers.

Data set				Events
Beam energy [GeV]	Torus current [A]	Trigger [mV]	Beam current [nA]	x10 ⁶
2.474	1500	CC(20)+EC(60-100)	2.5	150
5.77	2250	CC(100)+EC(72-172)+L2	8	1100

The deuteron structure function $F_2^D(x, Q^2)$ was extracted from the inelastic cross section using the fit of the function $R(x, Q^2) \equiv \sigma_L/\sigma_T$ as follows:

$$F_2^D(x, Q^2) = \frac{1}{\sigma_{Mott}} \frac{d^2\sigma}{d\Omega dE'} \frac{\nu}{1 + \frac{1-\epsilon}{\epsilon} \frac{1}{1+R}} \quad (1)$$

where the virtual photon polarization parameter is defined as

$$\epsilon \equiv \left(1 + 2 \frac{\nu^2 + Q^2}{Q^2} \tan^2 \frac{\theta}{2} \right)^{-1} \quad (2)$$

The ratio $R(x, Q^2)$ for the proton is well established in the DIS region and can be fairly well described by the SLAC parameterization from Ref. [17]. In the same time, the

Figure 1: Kinematic regions covered by measured data sets: the red area represents the E1d run period data taken at the beam energy $E = 2.474$ GeV; the blue area indicates the E6a run period data taken at the beam energy $E = 5.77$ GeV; the green points represent measurements from Ref. [5]; the black points show measurements from Refs. [6–14].

experimental data in the resonance region were missing until recently. The data from Hall C (TJNAF) published in Ref. [15] cover the entire resonance region and extend to very low Q^2 values. It was shown by HERMES Collaboration in Ref. [16] that in the DIS the ratio R does not depend on the nuclear mass number A . We take this assumption to be valid also in the resonance region. But, since Fermi motion smearing effects were expected to change both F_2 and F_L structure functions we performed a “smooth” parameterization of the measured ratio R . In this way the resonance structures, clearly seen on the proton, were averaged out in the medium curve. This “smooth” parameterization was obtained by modifying the fit from Ref. [17] R^{SLAC} as follows:

$$R^{smooth} = R^{SLAC} \left\{ 1 - \frac{W_{TH}^2 - C_W^2}{W^2} \right\}^{B_W} \left(\frac{Q^2}{Q_0^2} \right)^{C_Q} e^{-B_Q C_Q (Q^2/Q_0^2 - 1)} \quad (3)$$

where W is the invariant mass of the produced hadronic system, W_{TH} is its value at the pion threshold and the parameters are found by a MINUIT minimization procedure: $Q_0^2 = 0.8$ GeV², $B_Q = 2.14$, $C_Q = 0.729$, $B_W = 0.383$ and $C_W = 0.165$ GeV.

The comparison of two models is shown in Fig. 5. The difference between these two models gave us an estimate of the systematic errors of the ratio R , which turned out to be small.

The ratio R under the quasi-elastic peak is a separate issue. Because of the quasi-elastic peak nature it is not more independent of A and should be, therefore, treated within a nuclear model framework. We used the model from Ref. [18], which treats separately the longitudinal and transverse nuclear response functions R_L and R_T . The conventional ratio R can be calculated from these quantities as follows:

$$R = \frac{2Q^2}{Q^2 + \nu^2} \frac{R_L}{R_T} \quad (4)$$

In the Fig. 6 the obtained deuteron quasi-elastic ratio R is shown in comparison to the data on the ratio R for other nuclei (precise deuteron data on R in the quasi-elastic peak region are missing) and a sum of the proton and neutron form factors, which simply implies:

$$R = \frac{G_E^2}{\tau G_M^2} \quad (5)$$

where $\tau = Q^2/4M^2$ and G_E , G_M are the sums of the known Sachs form-factors of the proton and neutron. Since the number of protons and neutrons is different in different nuclei we did not expect to have the same ratio R for all of them. However, the x -shape of the ratio is likely very similar from nucleus to nucleus. In fact, in Fig. 6 it can be clearly seen. The calculations agrees reasonably well with the x -shape of the data, while the absolute values can be different. The systematic error can be estimated as a difference between the model calculation and the result of the naive form-factor sum through Eq. 5.

(a) $Q^2 = 0.475 \text{ GeV}^2$

(b) $Q^2 = 1.175 \text{ GeV}^2$

(c) $Q^2 = 2.375 \text{ GeV}^2$

(d) $Q^2 = 3.575 \text{ GeV}^2$

Figure 2: The deuteron structure function $F_2^D(x, Q^2)$ per nucleon for a few Q^2 values: the red points show CLAS data obtained in the present analysis; other color points represent various previous measurements from Refs. [5–14], where each separate experiment is indicated by a different color; the black solid line represents the phenomenological model used in the present analysis and described in Ref. [3].

Figure 3: The structure deuteron function $F_2^D(x, Q^2)$ per nucleon at $Q^2 = 1.925 \text{ GeV}^2$: the red and blue points show the CLAS data from E6a and E1d run periods, respectively; other color points represent the previous measurements from Refs. [5–14], where each separate experiment is indicated by a different color; the black solid line shows the phenomenological model used in the present analysis.

Figure 4: The deuteron structure function $F_2^D(x, Q^2)$ per nucleon at $Q^2 = 4.075 \text{ GeV}^2$: the red and blue points show the CLAS data from E6a and E1d run periods, respectively; other color points represent the previous measurements from Refs. [5–14], where each separate experiment is indicated by a different color; the black solid line shows the phenomenological model used in the present g_9 analysis.

Figure 5: The ratio $R = \sigma_L/\sigma_T$ as a function of the final hadronic system invariant mass W at $Q^2 = 0.425 \text{ GeV}^2$ (left) and at $Q^2 = 2.875 \text{ GeV}^2$ (right): the red curve represents a smooth fit to the world data in the inelastic region and the model from Ref. [18] in the quasi-elastic region; the blue curve shows the fit from Ref. [15] in the inelastic regime and the direct sum of the nucleon form-factors under the quasi-elastic peak region.

Figure 6: The ratio $R = \sigma_L/\sigma_T$ in the quasi-elastic peak region as a function of x at $Q^2 = 0.1 - 0.15 \text{ GeV}^2$ (left panel) and at $Q^2 = 0.85 - 1.1 \text{ GeV}^2$ (right panel): the red curve represents the model from the Ref. [18]; the blue curve shows the sum of the nucleon form-factors; the data points are taken from Refs. [19].
